LinkedIn | GitHub | Portfolio

PROFESSIONAL SUMMARY

Computer Science graduate with hands-on experience in Data Analytics, Machine Learning, Deep Learning, Data Engineering, and Automation Workflows. Skilled at building end-to-end ML pipelines, designing ETL workflows, performing exploratory data analysis, and developing interactive dashboards. Experienced with structured and unstructured data, experimentation frameworks, and container-based environments. Passionate about applying data-driven, AI-powered solutions to real-world business and healthcare problems.

TECHNICAL SKILLS

Languages & Databases: Python, SQL

ML / AI: Regression, Classification, Feature Engineering, Model Evaluation, CNN, Deep Learning, NLP, scikit-learn, TensorFlow, PyTorch

Data Engineering: ETL Pipelines, Data Ingestion & Transformation, Data Validation, Log-based Analytics, Apache Spark, Hadoop, Databricks

Automation: UiPath, Automation Anywhere, Workflow Automation, RPA Concepts

Analytics & Visualization: Power BI, Tableau, Matplotlib, Excel (Pivot Tables, VLOOKUP, Power Query), A/B Testing, Hypothesis Testing, RFM Segmentation, Cohort Analysis

APIs & Data Formats: REST APIs, JSON, XML, CSV/Excel Processing

Platforms & Tools: Databricks, Docker, Git, Jupyter Notebook, VS Code

EDUCATION

East Point College of Engineering and Technology, Bengaluru **2021 – 2025**

Bachelor of Engineering — Computer Science

Relevant Coursework: Data Structures, Database Management Systems, Machine Learning, Statistics, Big Data Analytics

EXPERIENCE

Deepcept AI Feb 2025 – Feb 2026

AI & Software Engineering Intern | Bengaluru, India (Hybrid)

- Developed and maintained data-driven internal tools, backend workflows, and analytics systems that improved operational visibility.
- Performed EDA, KPI tracking, and log-based analytics to identify trends, anomalies, and system performance issues.
- Assisted in ML model experimentation — feature selection, model tuning, and evaluation — contributing to improved prediction accuracy.
- Contributed to a Docker-based analytics platform for real-time monitoring of container performance metrics.
- Collaborated on automation of recurring data workflows, reducing manual processing time significantly.

PROJECTS

Log Analytics & Anomaly Detection using Databricks GitHub ↗

Tools: Databricks, Apache Spark, Python, SQL, Delta Lake

- Built a large-scale log analytics pipeline on Databricks using Apache Spark for real-time ingestion and processing of system logs.
- Implemented anomaly detection algorithms to identify irregular patterns, reducing mean-time-to-detect (MTTD) for system issues.
- Designed Delta Lake tables for efficient querying and storage of processed log data.

Medical AI Chatbot for Disease Prediction GitHub ↗

Tools: Python, Flask, scikit-learn, NLP, Machine Learning

- Designed an AI-powered chatbot for symptom-based disease prediction combining NLP and ML classification models.
- Structured healthcare datasets and engineered features to improve prediction accuracy across multiple disease categories.
- Deployed via Flask with a conversational interface, focusing on ethical AI handling and real-world healthcare applicability.

Customer Churn Analysis & Prediction GitHub ↗

Tools: Python, SQL, scikit-learn, Power BI, EDA

- Performed end-to-end customer churn analysis using RFM segmentation, SQL-based data preparation, and feature engineering.
- Built predictive ML models (Logistic Regression, Random Forest) and evaluated performance using precision, recall, and AUC-ROC.
- Created Power BI dashboards delivering actionable retention insights to business stakeholders.

A/B Testing & Experimentation Analysis GitHub ↗

Tools: Python, Statistical Hypothesis Testing, Data Visualization

- Designed controlled A/B experiments to assess the impact of UX/product changes on website conversion rates.
- Applied statistical hypothesis testing (t-test, chi-square) and confidence interval analysis to validate experiment results.
- Produced data visualization reports to communicate actionable insights to product teams.

AI Image Caption Generator GitHub ↗

Tools: Python, CNN, LSTM, TensorFlow, Flask

- Built an end-to-end deep learning pipeline combining CNN (image feature extraction) and LSTM (caption generation) architectures.
- Handled dataset preprocessing, model training, and integration into a Flask web app with a dark-mode UI.
- Generated context-aware, human-readable captions achieving strong BLEU score performance on test data.

CERTIFICATIONS

- Databricks Certified Data Engineer Associate — Databricks (2025)
- Google Analytics Certification — Google Analytics Academy (2025)
- Machine Learning with Python — Verzeo (2022)
